

## Your AI Assistant

Our AI Diagnosis is here to help analyze not just the problem but also matching you to a few mechanics based on their experience and location. Please take the time to ask any questions about the car or the process.

Hello axle, how are you today?

Hello, I'm good! How can I help you?

My engine won't start.

That sounds frustrating. There are a couple of common reasons this could happen:

1. A dead battery or alternator issue
  - If your battery is drained, your engine won't start, and the check engine light might turn on.
2. A faulty starter or ignition system
  - If your starter motor or ignition switch has failed, it could prevent the engine from turning over.

Would you like me to arrange a mobile mechanic to diagnose the issue on-site?

Yes please

Got it! I'll connect you with a certified mobile mechanic. They'll reach out shortly to confirm a time. In the meantime, if you have jumper cables, you might try a quick jump-start to see if it helps.
